

Edward Otero

Backend developer, Golang specialist

[Email](#) | +254 714 757 094 | [GitHub](#) | [LinkedIn](#)

Professional summary

Backend developer specializing in Go, with hands on experience designing server rendered web applications, REST APIs, and authentication systems from the ground up, including session management, role based access control, and database schema design. Comfortable working across the full stack with React, TypeScript, and Node.js when a project calls for it. Builds practical, production minded tools, from business systems to open source platforms, with a focus on clean architecture, data integrity, and systems that hold up under real use.

Technical skills

Languages: Go, TypeScript, JavaScript, Python, SQL, PHP, C, C++

Backend and frameworks: Gin, net/http, Node.js, Express, React

Tools and DevOps: Git, Docker, GitHub Actions, Linux, Ansible

Projects

Edu-Flix | *Go, JWT, bcrypt, SQLite/Turso, Render, GitHub Actions*

[GitHub](#)

- A full stack streaming platform styled after Netflix, with a Go backend serving REST APIs.
- Users needed secure accounts and session handling for a multimedia platform with no existing auth system.
- Implemented JWT based authentication, bcrypt password hashing, Gmail SMTP for account flows, and an SQLite/Turso data layer, deployed with automated CI/CD through GitHub Actions to Render.
- A working, deployed streaming app with a secure, testable authentication flow that runs end to end.

SatGate | *Rust, JavaScript, Lightning Network*

[GitHub](#)

- A Lightning Network powered contact form built in a four person hackathon team.
- The team needed a smooth, trustworthy payment experience under a tight hackathon deadline, and hit a Windows Rust linker conflict that blocked builds.
- Built frontend loading states (a Bitcoin pulse loader and shimmer skeletons) to keep the payment flow feeling responsive, and resolved the linker conflict by configuring the VS Build Tools linker path directly in .cargo/config.toml.
- Project shipped on time and won the Kisumu Bitcoin Bootcamp Hackathon 2026.

Tinah Cosmetics Business System | *JavaScript, local Storage, M Pesa*

[GitHub](#)

- A full boutique business operating system: a POS for in store sales and a companion e-commerce site.
- The business needed in store and online sales to stay in sync without running separate, disconnected systems.
- Designed a shared client side data layer between the POS and the website, added PIN based cashier authentication, M-Pesa payment support, cash on delivery logic scoped to Kisumu neighborhoods, and a bridge layer routing web orders into the POS.
- A single connected system where online orders appear directly in the POS, removing manual reconciliation between channels.

Experience

Tech support at Zone01 Kisumu *2024 to Present*

- Debug and review Golang code for peer projects to improve software reliability and performance.
- Automate repetitive system administration tasks using Ansible and manage Ubuntu based lab systems.

Stem mentor at Young Scientists Kenya, Kisumu *2022*

- Guided students through STEM projects and provided technical troubleshooting for staff and learners.

Education

Diploma in Information Technology at Maseno University *2022 to 2024*

Diploma in Business Administration at Nairobi University *2020 to 2022*
